# Antibacterial Soap & Hand Sanitizer Facts

**Antibacterial Soaps** main agent is **Triclosan** which is known to disrupt thyroid function. Triclosan stimulates the growth of breast cancer cells as well as bring about early onset of puberty.

Triclosan acts by killling all bacteria, including beneficial bacteria that fight infections, as well as healthy human cells. Organisms that are not susceptible to Triclosan have no competition & they mutate or replicate for its survival.

**Mutated bacteria develop resistance to many antibiotics & even antibacterial agents, leading to serious health complications.**

Natural strong immunity is developed through infancy and early childhood by being exposed to everyday germs. Children who grow up in a hyper sanitized environment develop more immune issues as teenagers and young adults.

**Overuse of antibacterial hand sanitizers & soaps leave your skin defenseless against dangerous bacteria.**

## *What should you do?*

- + Use plain soap & warm water whenever possible*
- + Only use hand sanitizer when washing your hands with soap & water is not possible*
  - o A natural hand sanitizer is just as effective as the popular Purell but without the high alcohol percent as well as having natural scents, no GMOs, & no Triclosan.*
