HPV Vaccine Facts

An HPV infection is a viral infection. There are **more than 100 types** of human papillomavirus (HPV). Of the six licensed HPV vaccines, each claim to protect against either two, four or nine types of HPV. **That's less than 10%.**

The United States is the only country in the world where pharmaceutical companies are not legally liable for defective vaccine products.

With the pharmaceutical industry being one of the largest purchasers of corporate media advertisement, negative vaccine information is routinely suppressed in the corporate “mainstream” media.

As of April 2026, the Vaccine Adverse Event Reporting System (VAERS)* has received **648 reports of death following HPV vaccination**, as well as:

- **3,946** **Reports of disability**
- **1,226** **Life-threatening events**
- **17,229** **Emergency room visits**
- **8,605** **Hospitalizations**
- **23** **Birth defects**
- **4,536** **Office visits to a doctor**

*Note: VAERS is a voluntary reporting system with typically only 1% of injuries being reported.

A few HPV Vaccine Ingredients You Should Know About:

- ❖ **Polysorbate 80**: Crosses the blood brain barrier (BBB), thus allowing toxins into the brain.
- ❖ **Insect cells** : Specifically, the Hi-5 cell line derived from moth cells.

For decades, vaccine companies have been using foreskin cells to research, grow & develop vaccines. **The child's DNA whose foreskin was used to make the vaccine cannot be fully removed from the vaccines prior to administration.**
